Experiment - 5 : Wireshark

8/09/26

Aim: To capture, filter and analyze network packets using wireshark and understand encapsulation of protocol layers.

Description:

* wireshark is a packet sniffer (formerly Ethereal). It passively captures packets in real time and shows them in readable form.

* It is used to troubleshoot networks examine security problems, debug protocols and learn protocol internals.

* The window has three panes:- packet list (one line per packet), Packet details (protocol tree) and packet bytes (hex dump)

* colours :-
  TCP :- Light purple
  UDP :- Light blue
  packets with error : Black

Procedure :-

(i) Open wireshark and select the interface (LAN)

(ii) Go to capture -> options and set "stop capture automatically after 100 packets".

(iii) click "start" capture, then stop and save the file.

(iv) Type a filter in the filter bar and press Enter.

(v) For a flow graph, go to statistics → Flow graph

(vi) Click a packet to inspect its layers

Result:- Packets were captured, filtered and analyzed successfully using wireshark.
